

# Kyvos Integration with BI Tools

Kyvos is a disruptive, enterprise-class solution that integrates with business intelligence tools to deliver interactive BI on data in the cloud or on-premise Big Data platforms. Our open architecture supports most BI and data science tools, from standard commercial tools to custom applications. The standard interfaces provide easy integration with third-party visualization and analytics tools using industry-standard connectors and APIs.

Most visualization tools use generic drivers for open connectivity such as ODBC. In most cases, if a tool specific driver is available, it should be used.
